Thermophysical Properties of Chemicals and Hydrocarbons

Carl L. Yaws

William Andrew

PREFACE

This book is the product of a life's work in analysis and presentation of property data helpful in the application of chemical engineering and scientific principles. It is not meant to be a theoretical treatise, but an aid to the practicing engineer and scientist in the field. The data contained in this volume provides important information that is helpful in design, research, development, and manufacturing operations. It is intended for quick use in both day-to-day operations and long range projects.

I hope that the readers find this information useful and treat this book as a "hands on" manual, something to get dirty and use in the field, in the lab, or in the office. It is not meant to sit on a shelf and gather dust, but to be a helpful tool for the engineer and scientist.

I would like to thank, again, everyone who made this book possible, including all of the contributors, all of the people at the publisher, William Andrew Inc., and my family and friends.

I especially wish to thank Phil Carmical for his encouragement and support over the years.

Carl L. Yaws
April, 2008

HOW TO USE THIS BOOK

Thermophysical properties for more than 7,800 chemicals and hydrocarbons are presented in this book for temperature dependent properties. Values for enthalpy of vaporization at normal boiling point are provided for more than 22,000 compounds. The comprehensive coverage includes C1 to C100 organics and Ac to Zr inorganics.

The property data are helpful in many engineering and scientific applications:

- **Molecular formula** – indicates size of molecule, determine groups for group contribution methods to estimate thermodynamic properties
- **Name** – identification of compound, helpful in locating safety regulations.
- ***In the tables, an **asterisk (*)** beside the name of a compound signifies that the name has been shortened to fit the format of the table. To see the full name, refer to the compound by CAS or ID number in chapter one.
- **CAS No** – Chemical Abstracts Registry Number, useful in specifying compound, helpful in finding MSDS data and locating manufacturers on web
- **Freezing point** – useful to determine state at normal conditions – gas, liquid, or solid, helpful in specifying containers for storage and shipping
- **Boiling point** – helpful in ascertaining temperatures required for vaporization in process operations, determine separation by distillation, characterize general volatility characteristics
- **Critical temperature** – useful in corresponding state correlations for thermodynamic and transport properties
- **Critical pressure** – helpful in corresponding state correlations for thermodynamic and transport properties
- **Acentric factor** – useful in corresponding state correlations for thermodynamic and transport properties
- **Critical volume** – helpful in corresponding state correlations
- **Critical density** – useful in corresponding state correlations
- **Critical compressibility factor** – helpful in corresponding state correlations
- **Density of liquid** – useful in design of storage vessels and shipping containers, useful in many engineering applications involving liquids, helpful in relief valve sizing for safety
- **Density of solid** – helpful in design of storage vessels and shipping containers
- **Enthalpy of vaporization** – useful in design of vaporizers and condensers, engineering applications involving saturated liquids and vapors, safety engineering such as ascertaining vaporization quantities from vessel rupture

- **Enthalpy of fusion** – useful in energy balance calculations

- **Solubility parameter** – helpful in vapor-liquid-equilibrium calculations
- **Liquid volume** – useful in engineering calculations involving liquids
- **Van der waals area and volume** – helpful in molecular thermodynamics
- **Radius of gyration** – useful in molecular thermodynamics
- **Dipole moment** – helpful in corresponding state correlations for polar compounds
- **Surface tension** – useful in heat and mass transfer correlations

Chapter 1

CRITICAL PROPERTIES AND ACENTRIC FACTOR – ORGANIC COMPOUNDS

Carl L. Yaws and Prasad K. Narasimhan*
Lamar University, Beaumont, Texas / *Invensys Process Systems, Houston, Texas

Tabulation Results

The results are given in Table 1. The tabulation is arranged by carbon number (C, C2, C3, ...) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. Values for freezing point, boiling point, critical temperature, pressure, volume, density, and compressibility factor are given in the adjacent columns. The code for each property is also given. The last column provides the acentric factor.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-39). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (1-2), Daubert and Danner (3), Dechema (15), TRC (13-14), Vargaftik (18), and Yaws (19-36) were used extensively for critical properties. Estimates of critical temperature, pressure, and volume were primarily based on the Joback method (10-12) and proprietary techniques of the author. Critical density was determined from dividing molecular weight by critical volume. Critical compressibility factor was ascertained from application of the gas law at the critical point. Estimates for acentric factor were primarily made by using the Antoine equation for vapor pressure (11-12).

A comparison of calculated and data values for critical temperature is shown in Figure 1 for normal alkanes. The graph shows favorable agreement of equation and data.

Example

In an engineering analysis, the critical properties and acentric factor are needed for ethylene (C2H4). Determine the critical properties and acentric factor for ethylene.

Inspection of the tabulation for critical properties and acentric factor yields:

Tc = 282.34 K

Pc = 50.41 bar

Vc = 131.0 ml/mol

rhoc = 0.2142 g/ml

Zc = 0.281

omega = 0.086

Code: 1 - data, 2 - estimate

T_F - freezing point critical temperature, K

T_B - boiling point critical temperature, K

T_C - critical temperature, K

P_C - critical pressure, bar

V_C - critical volume, ml/mol

rho_C - critical density, g/ml

Z_C - critical compressibility factor

omega - acentric factor

Chapter 2

CRITICAL PROPERTIES AND ACENTRIC FACTOR – INORGANIC COMPOUNDS

Carl L. Yaws and Prasad K. Narasimhan*
Lamar University, Beaumont, Texas / *Invensys Process Systems, Houston, Texas

Tabulation Results

The tabulation is arranged by alphabetical order (Ag, Al, Ar, ……, Zr) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. Values for freezing point, boiling point, critical temperature, pressure, volume, density, and compressibility factor are given in the adjacent columns. The code for each property is also given. The last column provides the acentric factor.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-38). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (1-2), Daubert and Danner (3), Dechema (15), Vargaftik (20), and Yaws (21-38) were used extensively for critical properties. Estimates of critical properties were primarily based on the methods of Gambill (9), Guldberg-Guye (8), Gates-Thodos (8), Grosse (8), Wilson-Jasperson (11), extension of vapor pressure curve, Benson (8), and Tyn-Calus (9). Critical density was determined from dividing molecular weight by critical volume. Critical compressibility factor was ascertained from application of the gas law at the critical point. Estimates for acentric factor were primarily made by using the Antoine equation for vapor pressure (12-13).

A comparison of calculated and data values for critical temperature is shown in Figure 2 for the elements. The graph shows favorable agreement of equation and data.

Example

In an engineering analysis, the critical properties and acentric factor are needed for ammonia (NH3). Determine the critical properties and acentric factor for ammonia.

Inspection of the tabulation for critical properties and acentric factor yields:

Tc = 405.65 K

Pc = 112.80 bar

Vc = 72.47 ml/mol

rhoc = 0.2350 g/ml

Zc = 0.242

omega = 0.2526

Code: 1 - data, 2 - estimate

T_F - freezing point critical temperature, K

T_B - boiling point critical temperature, K

T_C - critical temperature, K

P_C - critical pressure, bar

V_C - critical volume, ml/mol

rho_C - critical density, g/ml

Z_C - critical compressibility factor

omega - acentric factor

Chapter 3

DENSITY OF LIQUID – ORGANIC COMPOUNDS

Carl L. Yaws and Ralph W. Pike*
Lamar University, Beaumont, Texas / *Louisiana State University, Baton Rouge, Louisiana

Tabulation Results

The results are given in Table 3. For the tabulation, the following equation was selected for correlation of liquid density as a function of temperature:

$$\text{density} = A\, B^{-(1-T/C)^{\wedge}n} \qquad (3)$$

where density = saturated liquid density, g/ml
A, B, C, and n = regression coefficients for chemical compound
T = temperature, K

The tabulation is arranged by carbon number (C, C2, C3, ...) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. Values for regression coefficients are given in the adjacent columns. The temperature range for use is given in the next columns (TMIN and TMAX). The equation should not be used for temperatures outside this range. The next column provides the code for the tabulation. The last two columns provide a representative temperature and value for liquid density at the representative temperature.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-34). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (1-2), Daubert and Danner (3), TRC (11-12), and Yaws (15-33) were used extensively for liquid density. Estimates of liquid density were primarily based on Schroeder correlation (9, group contribution), Le Bas method (9, group contribution), and Tyn-Calus equation (9, critical volume).

A comparison of calculated and data values is shown in Figure 3 for a representative compound. The graph shows favorable agreement of equation and data.

Example

In an engineering analysis, the liquid density is needed for methyl chloride (CH3Cl) at 343.15 K. Determine the liquid density of methyl chloride at this temperature.

Substitution of the coefficients from the tabulation and temperature into the above equation yields:

$$\text{density} = 0.36320 * 0.26631^{-(1-343.15/416.25)^{\wedge}.28690}$$

density = 0.811 g/ml

code: 1 - data, 2 - estimate

density - density of liquid, g/ml

A, B, C, and n - regression coefficients of chemical compound

T- temperature, K

TMAX - maximum temperature, K

TMIN - minimum temperature, K

Chapter 4

DENSITY OF LIQUID – INORGANIC COMPOUNDS

Carl L. Yaws and Ralph W. Pike*
Lamar University, Beaumont, Texas / *Louisiana State University, Baton Rouge, Louisiana

Tabulation Results

The results are given in Table 4. For the tabulation, the following equation was selected for correlation of liquid density as a function of temperature:

$$\text{density} = A\, B^{-(1-T/C)^n} \tag{4}$$

where density = saturated liquid density, g/ml
A, B, C, and n = regression coefficients for chemical compound
T = temperature, K

The tabulation is arranged by alphabetical order (Ag, Al, Ar, ..., Zr) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. Values for regression coefficients are given in the adjacent columns. The temperature range for use is given in the next columns (TMIN and TMAX). The equation should not be used for temperatures outside this range. The next column provides the code for the tabulation. The last two columns provide a representative temperature and value for liquid density at the representative temperature.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-31). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of the values for the remaining compounds was performed.

The compilations of CRC (1); Daubert and Danner (3); Janz et. al. (5-6); Landolt and Bornstein (7); Vargaftik (16); and Yaws (17-31) were used extensively for liquid density. Estimates of liquid density were primarily based on Schroeder correlation (12, group contribution), Le Bas method (12, group contribution), and Tyn-Calus equation (12, critical volume). For the high melting compounds, most of the data for liquid density are only available in the region of the melting point. In the absence of data, the estimates at temperature much higher than melting point should be considered rough approximations.

A comparison of calculated and data values is shown in Figure 4 for a representative compound. The graph shows favorable agreement of equation and data.

Example

In an engineering analysis, the liquid density is needed for nitrogen (N2) at 94.68 K. Determine the liquid density of nitrogen at this temperature.

Substitution of the coefficients from the tabulation and temperature into the above equation yields:

$$\text{density} = 0.31422 * 0.28610^{-(1-94.68/126.20)^{.29660}}$$

density = 0.720 g/ml

code: 1 - data, 2 - estimate

density - density of liquid, g/ml

A, B, C, and n - regression coefficients of chemical compound

T- temperature, K

TMAX - maximum temperature, K

TMIN - minimum temperature, K

Chapter 5

DENSITY OF SOLID – ORGANIC COMPOUNDS

Carl L. Yaws and Daniel H. Chen
Lamar University, Beaumont, Texas

Tabulation Results

The results are given in Table 5. The tabulation is arranged by carbon number (C, C2, C3, ...) to provide ease of use in quickly locating the data by using the chemical formula. The compound name and CAS No (Chemical Abstracts Registry Number) are next provided. Values for representative temperature and density at the representative temperature are given in the adjacent columns. The next column provides the code for the tabulation.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-11). Both experimental values for the property under consideration and parameter values for estimation of the property are included in the source publications. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a database of values for compounds for which experimental data are available. The database also served as a basis to check the accuracy of the estimation methods. Upon completion of data collection, estimation of values for the remaining compounds was performed.

The compilations of CRC (1-2), Daubert and Danner (3), and Yaws (10-11) were used extensively for solid density. Many of the estimates are based on extending the liquid density to the triple point (3).

Example

In an engineering analysis, the solid density is needed for cyanogen bromide (CBrN) at 20 C. Determine the solid density of cyanogen bromide at this temperature.

Inspection of the tabulation for solid density yields:

density = 2.015 g/ml
